BITE308L – Artificial Intelligence

Project Report

<Project Title>

Team members:
<Reg. No> - <Name>
<Reg. No> - <Name>
<Reg. No> - <Name>

Slot / Team number: *<Eg: E2+TE2/27>*
Faculty In-charge: *Dr. Hemalatha S/Professor/SCORE*
Date of Review: *<DD/MM/YYYY>*

I. Problem Summary

Limit: 1000 words. State the problem, its context and significance, the objectives of the project, the dataset or problem domain, and the expected outcome.

II. Discussion on Related Works

Review a minimum of 10 research papers / patents relevant to the problem. Cite each work using the prescribed reference style.

S. No.	Paper/Patent (Year, author)	Summary	Methodology	Observations	Gaps / Limitations

III. Outcome of the Review

1. Gap / issue identified and the proposed solution

Summarise the research gap(s) emerging from the literature review and outline your proposal to address them.

2. Novelty of the proposal (what is new)

Provide a clear and specific statement of what is new in your proposal compared with the existing work reviewed above.

IV. Framework

1. Architecture diagram

Insert the overall system / model architecture diagram. Number and caption the figure (e.g., Figure 1: Proposed architecture).

2. Module description

Explain each module / block of the architecture in turn: its purpose, inputs, outputs, and the algorithm or technique employed.

V. Implementation Details / Experimental Set-up

Describe the tools, programming languages, libraries and hardware used; the dataset (source, size, pre-processing, train/validation/test split); model configuration and hyper-parameters; and the evaluation protocol.

VI. Results and Discussion

1. Evaluation metrics

List the performance metrics used (e.g., accuracy, precision, recall, F1-score, RMSE, BLEU, etc.) and justify their suitability for the problem.

2. Experimental results

Present the outcomes of your experiments using numbered tables, graphs and figures (e.g., confusion matrix, learning curves, sample outputs). Every table and figure must have a caption and be referred to in the text.

S. No.	Model / Configuration	Metric 1	Metric 2	Metric 3
1	*<Proposed model>*			
2	*<Baseline / existing method>*			

Table 1: <Caption – summary of experimental results>

3. Comparative analysis

Compare the proposed approach against the baseline and the existing methods reviewed in Section II. Include ablation or sensitivity studies where applicable.

4. Interpretation of results

Explain what the results mean, why the model behaves as observed, and whether the objectives stated in Section I have been met.

5. Comparison with related work

Relate your findings to the literature reviewed, indicating how the proposal addresses the gaps identified in Section III.

6. Limitations and challenges

State the limitations of the study (data, computational resources, assumptions, generalisability) and any challenges encountered, along with how they were handled.

VII. Conclusion

Summarise the problem addressed, the approach adopted, the key findings and the contribution of the work, and indicate the scope for future work (suggested length: 200–300 words). Do not introduce new results here.

VIII. References

List all works cited in the report, including the papers / patents reviewed in Section II, in a consistent style (IEEE format recommended). Number the references in the order of citation.
